Abstract (en)

[origin: EP0821112A1] The locking device (200) incorporates a stop bolt (202), which can be manually engaged in a back-cut (11) in the frame (10) or in the channel (1). The engagement mechanism is so formed that an operating force acting on the locking device for the engagement of the stop bolt has at least one force component directed vertically to the covering (2). The stop bolt is pivotably located around an axis parallel to the covering plane, whereby the operating force is directed either vertically or parallel to the covering plane. The covering comprises a grid (2).
