Abstract (en)

[origin: EP0822283A2] A spun-bonded web comprises two types, (a) and (b), of bi-component filaments of the same titre where the core material (1), polyethylene terephthalate, has a higher melting temperature than that of the sheath material (2), a binding polymer material. The ratio by weight of the sheath material of type (a) filament to type (b) filament, 2a:2b, is in the range 1:3 - 1:10 and over a cross-section of the web, the ratio by weight of type (a) filaments to type (b) filaments varies from 15 to 70%. This latter ratio changes through the cross-section planes of the web without noticeable phase boundaries. Also claimed is the apparatus for producing the web.
