Abstract (en)
[origin: WO9632858A1] A closed spectacles case (1) consists of two lateral elements (6) and an enveloping element (11) made of an elongated sheet of thin, resilient material having at its one end a section which is bent into cylinder sector form to constitute an end surface (5) of the case, a planar or slightly curved section which forms the bottom (8), a section which has been bent into cylinder sector form to constitute a second end surface (4), a planar or slightly curved section which forms the cover surface (10) and a section at the opposite end of the elongated sheet which has been bent into cylinder sector form to constitute a hooked locking means (9). The two lateral elements are permanently joined with those portions of the elongated sheet which constitute the bottom and the two end surfaces and brace these sections whereby they provide a solid bottom portion of the case. The unbraced portion forms a resilient cover (3) of the case.
