Abstract (en)

[origin: WO9635366A1] An implement for simultaneously drying a surface and collecting a liquid has a body (10) on which can be clipped a removable drying head (9), the head having a plate (2) covering the entire width of a flexible drying blade (1) adhered under the plate and having attachment means (5) matching those of the body (10). A capillary substrate (6) with an operational edge under the region of the liquid bead to be collected is attached to the underside (13) of the blade (1). The substrate is dried out by means of a compression plate (20) which is actuated manually or by a lever (23) acting on said compression plate, which discharges excess liquid in a collection container (25) mounted under the handle (11) of the implement.
