Abstract (en)

[origin: FR2745221A1] A sequential cutting device comprising a cutting tool is disclosed. Each cutting device comprises an individually adjustable device (30), a return device (23) for returning a pad (25) towards the adjustable device (30), and a control device such as an eccentric (22) or a connecting rod system. When the control device (22) is at its highest point, an abutment surface (38) engages an abutment surface (33) on an abutment bridge (30) and thus defines a pre-cutting position. When said control device is at its lowest point, the eccentric spaces the pad (25) from the abutment bridge (30) and thus defines a cutting position. A method wherein pre-cutting and cutting lines are produced in a single station by preselecting the cutting devices is also disclosed.
