Abstract (en)
[origin: EP0824876A1] The fastening device (1) has two parts (2) drawn together by magnetic attraction. The parts are formed as two hollow bodies (3) adapted to receive a magnetic insert (4). The open sides of the hollow bodies are covered by platelets (5) which grip so as to fit together at the opening edge (6) of the hollow body. The peripheral edge (8) of the covering platelet is chamfered, in order to lock in place at the round opening (7) of the hollow body, clicking into place at the opening edge (6) and into the body.
