Abstract (en)

[origin: DE19516666A1] The transfer device has a transfer member (UO) which takes up the unit load (S) arriving on a first conveyor (FE1) between an endless conveyor belt (FB) and an endless pressure belt (AB) and places it on circulating unit load supports (ST) of a second conveyor (FE2). The unit load (S) is reliably and carefully transferred in that the deposition region (AW) of the transfer member (UO) can move in the direction of travel (TR) of the unit load supports (ST) and the transfer member (UO) and the second conveyor (FE2) are directed relative to each other in such a way that the unit load (S) is deposited in the appropriate unit load support (ST) without movement component transversely to the direction of travel (TR).
