Abstract (en)
[origin: EP0826330A2] The present invention relates to a child's bed whose bed or cot bottom is easy to adjust vertically. This is made possible by the manner in which the bed bottom is supported vertically with the aid of supporting means (4). The supporting means (4) comprise elongated support means which are equipped with hand grips and which are throughgoing in relation to the ends (20) of the bed and which are arranged in elongated vertical openings (21), which are provided with engagement side-recesses (22). Catch means secure the engagement between the respective support means and recesses. A special rotation of the support means is required for loosening the engagement. <IMAGE>
