Abstract (en)

A method for cutting a recess (13) in foam material (8), wherein by means of a first and a second knife (2,3) two cuts are provided in a surface of a foam-made block (8) or like object through a relative, linear movement of the object relative to the knives, wherein the first and the second knife (2,3) include an angle relative to each other and wherein, during use, the material located between the cuts and the contour of the object is removed for forming the or each recess (13), wherein at least the or each second knife (3) is substantially circular, is mounted on a central axis of rotation (15) and, during use, is driven in a rotational sense, wherein during use, the axis of rotation (15) is at least partly located within the contour of the object (8), in such a manner that during cutting, the relevant knife (3) extends within the contours of the object (8). <IMAGE>
