Abstract (en)
[origin: EP0826530A2] A heating apparatus for an automotive vehicle in which a rotor (21), driven by power applied from the prime mover, is enclosed in an operation chamber (R1) containing viscous fluid. A hydraulic control mechanism (40) is used for charging and discharging the viscous fluid in the operation chamber (R1) and its operation is dependent on the temperature of the cooling water. A water jacket (35,36) stores the cooling water and transfers shearing heat caused by rotation of the rotor (21) from the viscous fluid to the cooling water. In the heating apparatus, a rotary accessory device (B) such as a hydraulic pump, a compressor, a water pump or the like is driven by power applied from the prime mover of the vehicle. <IMAGE>
