Abstract (en)
[origin: EP0826849A2] The system has a profiled holding member (22), onto which an oblong profiled facing member (24) is secured by suitable holders (32,34). The holding member has an anchoring flange (26) securing it in a support plate at the outer balcony edge, and a holding portion (30) protruding forwards beyond the balcony edge, and securing the facing member. The holders (32, 34) are formed so as to allow relative movement of the holding and facing members in the lengthwise direction of the latter. The holders can contain grooves narrowed at their mouth, and into which mating tongues are slid. Alternatively, there can be an elongated hole in which a screw or bolt engages. Relative movement can be limited by stops.
