Abstract (en)
[origin: EP0826850A2] The support structure has at least one mounting (13) secured to the wall (10) of the building. There is a support profile mounting (15) receiving the support profile (12) for the fascia panel, coupled together via a pivot arm (17). The angle of the pivot arm is adjusted to determine the spacing of the support profile from the wall surface. Pref. the pivot arm is acted on by a pivoted support arm (21), with vertical play between the pivot arm and the wall mounting, or the support profile mounting, to compensate for variations in the length of the support profile.
