Abstract (en)

[origin: EP0826855A2] The lock (1) has a rotary trap which can be locked and released by a latching pawl (1.9). A coupling part (2.6) movable by a control device applies a releasing force to the latching pawl or not depending on an operator command. The coupling device can be moved into at least three positions by the control device (2). Each handle, i.e. the inner (3) or outer door (4) handle, is connected via connecting elements to a coupling element (1.11) which acts directly on the latching pawl or not depending on the coupling device position.
