Abstract (en)
[origin: EP0827312A2] The method involves announcing a change in a data packet configuration via control data. A field is transmitted in the data packets. The content of the field indicates a change in configuration for the transmitted data packet and the further transmitted data packets. The header of the data packet may contain a bit which is set or reset when the error protection or data packet length changes. The number of the header counter field may indicate a change in the error protection or data packet length.
