Abstract (en)  
[origin: EP0828038A2] The floor support has a foot and a height-adjustable metallic shaft (4). The shaft comprises two threaded shaft parts (5,6), one of which screws against the other to adjust the shaft height. The shaft also has a ball dome (10), and possibly a counter dome working co-operating with the ball dome, to provide inclination compensation. The foot is a non-metallic socket (1), formed of a mineral material, which loosely accommodates the shaft and has a recess (2,3). At least one nose formation (8) on the shaft co-operates with the recess to secure the shaft against twisting. The part of the shaft that fits in the recess has a locating flange (7) for location on the socket.
