Abstract (en)

[origin: WO9638530A1] A granular washing or cleaning agent with a high bulk density containing extruded components and anionic and/or non-ionic tensides in quantities of at least 15 wt.% and having improved solubility is to be prepared. The improved solubility is to be obtained in particular in that gelling is largely prevented when the agent is dissolved in water. This is achieved in that the agent contains at least two different granular components, at least one of which is extruded and at least one is not, where the extruded component(s) is/are present in quantities of 30 to 85 wt. % in relation to the whole of the agent, the tenside (including soap) content of the extruded component(s) is 0 to less than 15 wt.% in relation to the extruded component and there is at least one non-extruded, granular and tenside-containing component in the agent in quantities such that at least 1 wt.% in tensides, in relation to the whole of the agent, is prepared by this component.
