Abstract (en)

[origin: WO9638641A1] The object of the invention is a telescopic device, especially a spreader, support or clamp, with two telescopic rods (5, 6), in which the two rods (5, 6) can be moved in relation to each other via a strand, one end of which is fitted in the region of one end of one of the rods and is guided around a deflector (1) which is secured to the end of the other rod at the end away from the first, where there is a traction device by means of which the strand can be shortened between the end of the strand secured to one of the rods (5, 6) and the traction device; the feature of the device is that the strand is a belt (2) and the traction device is a tensioner (36).
