Abstract (en)
[origin: EP0829422A2] The rotor rotary axis and the vane pivot axes run parallel to one another and vertically. The adjustment of the vanes (1) is achieved by a central control wire bar, via a rod which forms the propeller kinematics. Additional devices (5) are provided, which with the rotor blocked effect an adjustment of the vanes in the sailing position, with which the vanes extend parallel to one another and which bring the vanes out of the sailing position into any required steering position. The additional devices engage the vanes via a gear (3,4) and may comprise hydraulic stroke cylinders, installed at a suitable position of the propeller kinematics. In the event of thrust crank kinematics, the cylinder completely or partly replaces the coupling rod (19) of the propeller kinematics.
