Abstract (en)
[origin: WO9641058A1] A wash station comprises a sink and a water dispensing faucet operably associated with the sink for selectively dispensing water thereto. A first sensor is operably associated with the sink for determining the presence of a user. An electrically operated valve is in flow communication with the faucet for causing water to be selectively supplied thereto and operably associated with the first sensor for being actuated thereby. A soap dispensing faucet is operably associated with the sink for selecting dispensing soap. A second sensor is operably associated with the soap dispensing faucet for determining the presence of a user in operable association with the soap dispensing faucet. A pump is in operable association with a soap supply, in fluid communication with the soap dispensing faucet, and in operable connection with the second sensor for causing soap to be selectively supplied to the soap dispensing faucet upon detection of a user by the second sensor.
