Abstract (en)

[origin: EP0830830A2] The perforated and unperforated areas alternate along one side (2) of the curtain, each perforated one containing two or more pairs of holes (5-14) closer together than the remaining holes. A suspension component is threaded through the holes which are closer together, so as to form folds in the curtain. The holes which are closer together can all be at the same distance apart, and a single hole can be provided between the holes in adjacent pairs. The holes in pairs can be at different distances from the side of the curtain. The latter can be reinforced at the holes, and woven or knitted. The perforated area can form a closing edge (3).
