Abstract (en)

[origin: EP0830937A1] The method involves first feeding source material for the bag handles (48) in the form of a single material strip (20) which is then continuously separated into several parallel strips (38,40) for the individual handles. The tensioning of the source material strip is controlled so that the pull-in speed for one strip section (38) is determined by the working speed of a corresponding handle laying device, and the tensioning of the other strip section (40) is adjusted to a value which is in proportion to the tensioning of the source material strip.
