Abstract (en)

[origin: WO9639187A1] Methods for treating and inhibiting disease and symptoms associated with the human immunodeficiency virus (HIV) are provided. The method includes transforming the human immunodeficiency virus (HIV) infection into a nonserious disease through the infusion of monoclonal antibodies directed against particular antigens on anti-self, anti-CD4 cytotoxic T-lymphocytes. The method is further useful in the treatment of molluscum contagiosum arising due to human immunodeficiency virus (HIV) infection.
