Abstract (en)
[origin: EP0833032A2] The compound profiled section, comprising an inner profile (5) on the room side and a spaced outer profile (6) with heat-insulating connecting sections (8). The connecting sections have opposing transverse webs (13) which leave between their end sides a space extending in the transverse direction (2). This space forms a passage for the direct radiation exchange between the outside (10) of the outer profile and the outside (9) of the inner profile which is opposite same in the longitudinal direction (7). The cross webs are arranged aligned in the transverse direction. The actual length of each web measured in the cross direction is at least 15 % of the actual length of each associated insulating profile (8) measured in the longitudinal direction.
