Abstract (en)
[origin: WO9641055A1] A noise suppression device for railway tracks extends in a direction in parallel with the longitudinal direction of the track. The device is longitudinally divided into sections which each are movable between a first position in which it extends in a substantially vertical direction close to the building gauge of the track, and a second position in which the section is removed from the vicinity of the building gauge. Each section is completely or partly concealed in its second position. Each section comprises means to move it between the two positions, and these means are adapted to be remote-controlled.
