Abstract (en)
[origin: WO9701075A1] The invention concerns a device for camouflaging military equipment, the device consisting of a frame with several arms (1) designed to carry camouflage netting or other camouflage devices, one end of at least some of the arms (1) being attached to a connector (2, 10, 12) and the arms (1) being flexible, in particular elastically or plastically deformable. In order to ensure ease of handling, the connectors (2, 10, 12) can be rotated about at least one axis (A) towards the equipment (G) to be camouflaged, from a not-in-use position, in which the arms (1) lie essentially parallel to each other on the equipment (G), into a position of use in which the arms (1) point in different directions and at least partly cover the equipment (G) with the netting or other camouflage devices.
