Abstract (en)

A magnetic recording medium having a substrate disc with microscopic bumps formed by focusing a laser beam, wherein spacings D between adjacent microscopic bumps in the circumferential direction of the disc are varied so that the formula " $1 \leq (D_{max} - D_{min})/D_{avg} \times 100 (\%) \leq 200$ " is satisfied, wherein D_{max} , D_{min} and D_{avg} are the maximum, minimum and average spacings, respectively, as determined by a method wherein 2.5% of the total number of spacings D, having the largest dimensions, and 2.5% of the total number of spacings D, having the smallest dimensions, are excluded; and D_{max} , D_{min} and D_{avg} are measured on the remaining 95% of the total number of spacings D. The bump spacing variation is attained, for example, by modulating the pulse repetition frequency F of laser beam so that the ratio of " $(F_{max} - F_{min})/F_{avg}$ " is maintained in the range of 0.01 to 100, wherein F_{max} , F_{min} and F_{avg} are the maximum, minimum and average values, respectively, of the F of laser beam.
