Abstract (en)  
[origin: WO9701938A1] Contact components (2) of a main distribution board (1) are each provided with connection elements (4) for internal lines (8) leading to relay devices and with connection elements (5) for external lines (9) leading to subscribers (e.g. 20). The connection elements (4, 5) are connected to one another via disconnect contacts (3). The connection elements are each provided with two connection points (7) to which can be connected, in addition to the internal lines (8) and external lines (9), jumper lines (8) which can be laid between contact components (2) assigned to different subscribers. Interruption of the appropriate disconnect contact (3) prevents direct contact between these subscribers. Separate contact components for the internal lines (8) and external lines (9) can now be dispensed with, thereby considerably reducing the number of contact components (2).
