Abstract (en)
[origin: DE19641810C1] A device is provided which secures the blade basket against turning around its own axis. A sharpening device (4) incorporates one or more sharpening tools, and in a parallel direction to the blade basket axis can be moved forwards and backwards along the blades (3.3) for sharpening purposes. The sharpening device and the blade basket can be turned relatively to one another on a time basis, in order to bring the sharpening device into a new work position after sharpening a blade or a group of blades. The work surface of the sharpening device can be brought to such a position relative to the cutting edge of the blade that a free angle is sharpened.
