Abstract (en)

[origin: EP0835825A2] The plastic container (10) contains an element (30) in the form of a paper disc to contain an anti-corrosion agent which diffuses out of the disc as arranged in the integrity seal. The element contacts one endface of the item and thus acts both as damper and end stop. The container may come in the form of a hollow cylinder having seal and removal opening (13) at opposite ends. The integrity seal may comprise a stopper whose radial grooves (25) work with corresponding grooves (26) on the container inside. A tear-open tab (19) at the removal opening may be flush with the container casing surface (15), and stopper and seal hold the item radially within the container. The seal may have straps (29) to hold the disc element in place.
