Abstract (en)

[origin: EP0835837A2] The print products are moved on the folding table plate (6,7) and finally retained by stops (16,25) which have collision surfaces. Directly before the stops, any collected loose material is removed during operation, so that the stops which are located between spaces are removed and the spaces are in communication with one another. The stops, individually or in groups, are vertically movable in relation to the folding table plate (6). A cleaning device may be provided in the area of the folding table plate, which acts on the collision surface. The print products are movable by transport devices (12,13) spaced apart from one another and acting parallel to one another.
