Abstract (en)

[origin: EP0837432A1] The device (1) consists of a transmitter (4) which transmits at least one periodic interrogation signal into an interrogation zone (3). The interrogation signal stimulates a security element (2) to transmit an identity signal which is received by a receiver (5). A computer/control unit (7) evaluates the received identity signal and triggers an alarm if the security element is identified. The computer/control unit evaluates the received identity signal wrt. its amplitude and phase, detects a noise signal contained in the received signal and frees the received signal from the noise signal.
