Abstract (en)
[origin: WO9703270A1] The invention relates to a setting block in the form of a spacer (6) for supporting and adjusting a sheet member (5), preferably in the form of a glass package in structure elements, such as windows, doors and the like. The spacer (6) is provided with at least one rounded formation (7) on at least one of its edge sections, which are directly or indirectly connected to the spacer so that a mounting of the spacer will be easier to carry out and result in a reduced risk for damage influence on the sheet member (5).
