Abstract (en)

In a pneumatically operable strapping tool (10), a tension lever (24) is provided for controlling an internal pneumatic or air control valve which, in turn, controls an air motor drive operatively connected to a feedwheel (18) which tensions the strapping, disposed about an article or package to be strapped to a predetermined tension level. A seal lever (36) is provided in conjunction with the tension lever (24) so that upon completion of the tensioning phase of the strapping operation, the seal lever (36) is actuated to initiate the sealing phase of the strapping operation. To prevent a partial loss or a reduction of the tension level within the strapping which normally occurs during the transition between the tensioning and sealing phases of the strapping operation, the seal lever (36) is provided with a tang, tab, or ear member (40) which physically engages the tension lever (24) so as to maintain the tension lever at its operative or active position during the sealing phase of the strapping operation. In this manner, the tensioning phase of the strapping operation is not prematurely terminated and termination of the tensioning phase of the strapping operation is effectively delayed until the sealing phase of the strapping operation has been completed. Therefore, a proper tension level within the sealed strapping is achieved. <IMAGE>
