Abstract (en)
[origin: EP0840062A1] The lining comprises a casing of fibre reinforced plastics pipe sections (3) with soft compensators positioned between them. A ventilated annular gap (5) is formed between the casing (2) and the pipe sections. Several arms (6) extending in the pipe longitudinal direction are formed on the reverse side of the pipe sections in a peripheral direction. The arms have an angled adjacent base flange (7). The base flanges are guided in sliding seats (8) spaced apart in the pipe longitudinal direction, and are positioned at fixed points on a cross-sectional plane of the pipe sections, and are fixed to the casing. Each sliding seat consists of a slide plate (10) and a rail (11) gripping over the exterior of the base flange.
