Abstract (en)
[origin: WO9705322A1] A device (10) is used to wind and unwind a textile web (1) on a spool (20) when it comes in out or of a wet processing group (2). The device has a deflecting and pressing roller (11) that is mounted at the free ends of winding arms (8) and presses against the spool (20). A dehumidifier (30) designed as a suction pipe (12) is mounted immediately upstream of the pressing roller (11). The textile web (1) may thus be wound on the spool (20) with a relatively low humidity content.
