Abstract (en)

[origin: WO9743939A1] The invention features a mobile vacuum cleaner comprising a suction pipe, a suction unit and a fixing nozzle (20) forming the end of the suction pipe mounted in communication with the suction unit, which consists in particular of a frame (13) in which is fitted a removable bag (1) serving as dust collection container, the said bag (1) being provided with an obturating flap (5) movable between a position for opening and a position for closing the suction circuit by means of a controlling member (11) mounted on the frame (13) and co-operating with the nozzle (20) by co-operating means thus enabling the opening and closing of the bag (1) with a locking action and an unlocking action of the nozzle (20) on the frame (13) respectively. A blocking device (102) is used to prevent the frame (13) from opening so long as the nozzle (20) remains locked on the said frame (13).
