Abstract (en)
[origin: WO9748571A1] The invention relates to a motor vehicle seat with mutually movable side supports (14) of seat components (12) adjustable by means of an adjusting device (16). As the state of movement of the vehicle can be detected by a detecting device, allowing the adjuster (16) to control at least one side support (14) via an actuator (18) in such a way that, during lateral acceleration during travel the seat user is automatically relieved of stress, a motor vehicle seat is provided which effects a dynamic seat adjustment for the user dependently upon the prevailing state of movement and thus makes him/her more comfortable.
