Abstract (en)

[origin: EP0843044A1] The machine has a chassis supported by an under carriage. In the chassis there is a primary drive source, at least one building material bunker and a longitudinal conveyor leading to a rear discharge area. There is also a work place (A1,A2) for people. At least one discharge channel (14,14') has a suction device (V,V1) connected to it which takes in gaseous emissions from the construction material. Over a machine driver work place (A1) a roof or cabin structure (D) is provided, supported on the chassis and the discharge channel forms part of the support (E) of the roof or cabin structure. The roof structure has at least one hollow support component (8,9) which forms support wall on which the discharge channel is fixed or is formed in it as a hollow profile (H).
