Abstract (en)

This invention relates to an improved process for preparing selected N-acyl-aminodiacids I such as lauroyl glutamic acid wherein said process comprises (a) reacting an excess of a compound of Formula II: <CHEM> wherein: M<1> and M<2> are each independently selected from the group consisting of hydrogen, sodium, potassium and ammonium with a chloride of Formula III: <CHEM> wherein: y = 0 - 18, in the presence of a water/polar organic solvent mixture with a sufficient amount of base to form a reaction mixture from which a disalt form of the compound of Formula I may be obtained; and (b) adding the disalt form of Formula I to an HCl solution to form the compound of Formula I; provided that the compound of Formula III is added in an amount such that: (a) it does not exceed 95% of the molar equivalent amount of the compound of Formula II added initially; (b) the pH value of the reaction mixture is maintained in the range of 9-13; and (c) the temperature of the reaction mixture is maintained in the range of 0 - 10 degrees C.
