Abstract (en)

[origin: WO9707957A1] The injection-moulding unit proposed has a support block (10) and an injection bridge (25) which can be moved towards and away from the support block (10) in order to cause conveyor means (72) to move relative to a receptacle (17). This injection motion is produced by a motor (51) driving several spindle drives (E). The injection bridge (25) has a recess or aperture in which the motor (51) comes to rest.
