Abstract (en)  
An antiffilling closing device for bottles, or similar, comprises a pouring device (1), meant for forcing and sealing engagement into the mouth (2) of a bottle (B), or similar. The pouring device has a plugging body (6), which is held in one passage chamber (4) between at least one pouring opening (11) and one passage opening (5) communicating with the inside of the bottle (B), and interacting with the plugging body (6). The compartment (1) for the plugging body (6) inside the pouring device (1) is closed at its outward end by a part of the pourer, which is connected to the rest of it by predeterminedly breaking zones (13, 13'), which are meant to break, irremediably damaging the pouring device when an attempt is made to remove it from the mouth of the bottle. According to the invention, the predeterminedly breaking zones (13, 13') between the two parts of the pouring device (1) are made of at least one weakened wall and have an at least inclined or perpendicular orientation with respect to the direction of its removal from the mouth (2) of the bottle (B). <IMAGE>
