Abstract (en)
[origin: FR2746027A1] A roller skate of the in-line type comprising a shoe of which the sole is associated with an upper plate of a frame on which are arranged the rollers capable of cooperating with decelerating means which can be actuated by the skater, characterized in that said means are comprised of a relatively flexible friction element (13) which extends above at least one of the rollers (6), between an anchoring point (14, 30) situated in front of the roller and actuation means (15) situated at the back and which are capable of causing by exerting a traction or pressure force on said friction element (13), the displacement of the later in a radial direction with respect to the tread of the roller (6) with which it comes in contact in order to decelerate said roller, proportionnally to the force (F) applied by the skater on the actuation means (15).
