Abstract (en)
[origin: WO9709568A1] The invention concerns a "living flame"-type gas burner, i.e. a gas burner of which the flames bring artificial coal or logs to a given degree of incandescence. The gas burner is characterized in that it comprises a combustion chamber in which the mixture of fuel (gas) - oxidizing agent (primary air) circulates. At the top, the combustion chamber comprises a flat metal sheet (2) for receiving an artificial fuel, said metal sheet having holes (3) through which the fuel-oxidizing agent mixture passes. The holes (3) are disposed at the edge of the flat metal plate (2) in the vicinity of the area in which the secondary air circulates.
