Abstract (en)
[origin: EP0848921A1] A method for the manufacture of brushes, comprising an assembly phase during which a brush body, composed of one or more elements, and a filament-holder loop, or a similar element for supporting fibres, are subjected to the action of pressing means so as to define a mechanical constraint between brush body and filament-holder loop or similar element; the method entails associating stably to the brush body, in the course of assembly, a tag (2) reporting a series of data, indelibly reproduced, identifying the brush and/or the operating procedures for the brush itself; the brush is of the type presenting a brush body, comprising one or more elements, and a filament-holder loop, or a similar element for supporting fibres, mechanically constrained to each other by means of a blocking element rimmed in at least one end and it is provided with a tag (2), reporting a series of data identifying the brush and/or the operating procedures for the brush itself, irremovably fitted between a portion of the blocking element (6; 3) and the brush body. <IMAGE>
