Abstract (en)
[origin: EP0849190A2] The frame (1) comprises a locking mechanism (21,22), coupled to locking members (14) for retention of the engines on the frame. An actuating lever (30) allows several locking members to be operated simultaneously. Preferably the locking members each consist of a bolt held on a foot (7-10), each of which ends in an open fork (11), the arms of which (12,13) allow the bolt to be moved and pass over a ledge on the engine to hold it in place. Feet are arranged in two rows parallel to the central axis of the base of the frame, two adjacent feet being associated with opposing feet of an engine.
