Abstract (en)

[origin: EP0849215A1] The gripper heads (3) for the closure caps are raised and lowered. Each gripper head contains a ram (4) which is locked at a certain height by a thrust piece (5) at several dispenser points (38,39). The thrust pieces are positioned on the underside of the rotor (2) and, in conjunction with a lifting movement of the gripper heads, completely open the appropriate gripper appliance (6). The lifting movement of the gripper heads is controlled by a stationary lifting cam (13) into which fit cam rollers (12) joined to the gripper heads.
