Abstract (en)
[origin: DE19653105C1] An electromagnetic relay including a U-shaped core yoke (5) carrying a bobbin with a winding (2), and a flat armature (9) bridging the free ends (6a,8a) of the yoke (5) when the coil is excited. A switching tongue (14) is arranged in a plane approx. parallel to the armature (9), and comprises a long strip fixed at one end and supporting at least one movable contact (14a) at the other. At least one pair of fixed counter-contacts (12,13) are bridged by the tongue (14) in one of their switching positions. The switching tongue (14) specifically, made of ceramic consists of a highly insulating material having a high degree of rigidity and slight relaxation properties at high temperatures, with a bridging contact (14a) made of a high-conductivity material at its contact-making end.
