Abstract (en)

A compact apparatus for carrying out a programmed recording is disclosed. Teletext data detected by a teletext circuit section (13) of a TV (10) is used as a programmed recording information, so that a programmed recording can be carried out in a simple and exact manner even without installing a teletext circuit section within a magnetic recording/reproducing apparatus (20). By utilizing a teletext function, a channel information stored in the magnetic recording/reproducing apparatus (20) is compared with a channel information of a programmed recording information received through a scart jack (30). If the channel information is same as the channel information stored within the magnetic recording/reproducing apparatus (20), then the programmed recording is carried out, and if it is not same as the latter, the user inputs the channel, thereby carrying out a programmed recording based on the received programmed recording information in a simple manner.
