Abstract (en)
[origin: WO9709912A1] The invention concerns an automatic bag-dispenser which comprises a supply of bags (30) arranged flat in a stack (3), and two rotary devices (1, 2) which have parallel axes, are located adjacent each other and are covered with a non-slip material. The rotary devices (1, 2) rotate in counter-rotation at linear speeds which differ at their periphery. At least one of the rotary devices (1, 2) can come into contact with one of the two end bags (30) in the stack (3) in the region of the bottom (32) of the bag (30) such that it can be driven between the rotary devices (1, 2). At least one of the rotary devices (1, 2) comprises a central part which is not rotated and opposite which devices (4) for gripping the centre part of the bag (30) are active.
