Abstract (en)  
[origin: WO9709263A1] A yarn-feeding device (F) comprising a stationary housing (1) and a rotatably driven reeling element (9) with an outer ring-like lip (11) that overlaps an inner housing flange in an axially open slot (S). At at least one point on the perimeter (13) of the housing flange (12), within the overlap (Ü), there is a collector (C) which either projects into or withdraws from the slot (S) thus removing any dirt adhering to the inner surface of the lip (11).
